AGRICULTURAL LAND CLASSIFICATION REPORT

TEST VALLEY BOROUGH LOCAL PLAN REVIEW SITE 4 LAND SOUTH OF BARTON STACEY HAMPSHIRE

INTRODUCTION

- 1 This report presents the findings of a detailed Agricultural Land Classification (ALC) survey of 6 4 ha of land on the southern side of the village of Barton Stacey The survey was carried out in July 1996
- The survey was commissioned by Ministry of Agriculture Fisheries and Food (MAFF) Land Use Planning Unit (Reading) in connection with the Test Valley Borough Local Plan Review This survey supersedes previous ALC surveys on this land
- The work was conducted under sub contracting arrangements by NA Duncan and Associates and was supervised by members of the Resource Planning Team in the Guildford Statutory Group in ADAS. The land has been graded in accordance with the published MAFF ALC guidelines and criteria (MAFF 1988). A description of the ALC grades and subgrades is given in Appendix I
- 4 At the time of survey the whole site was growing winter barley

SUMMARY

- The findings of the survey are shown on the enclosed ALC map The map has been drawn at a scale of 1 10 000 it is accurate at this scale but any enlargement would be misleading
- The area and proportions of the ALC grades and subgrades on the surveyed land are summarised in Table 1

Table 1 Area of grades and other land

Grade/Other Land	Area (hectares)	/ Total Site Area	/ Surveyed Area
2	4 6	71 9	71 9
3a	18	28 1	28 1
Total Surveyed Area	6.4		100 0
Total Site Area	64	100 0	

- The fieldwork was conducted at an average density of approximately 1 boring per hectare. A total of 9 borings were described which were backed up by data from 2 soil pits in similar soils on a neighbouring site (Site 3 Land East of Barton Stacey ADAS Job No 1512/92/96)
- The majority of the site has been classified as Grade 2 very good quality agricultural land with an area of Subgrade 3a good quality agricultural land on the higher land at the south eastern corner of the site. The soils on the site comprise silty clay loams overlying chalk at moderate depths with some relatively shallow profiles in the south eastern corner of the site. Soil pit observations on the neighbouring site show that plant roots extend into the underlying chalk for at least 30 cm. Moisture balance calculations indicate that under the prevailing climatic conditions the majority of the site will be slightly droughty restricting the land quality to Grade 2 with more droughty conditions occurring in the south east corner which was reflected in the slightly poorer crop quality restricting this area to Subgrade 3a.

FACTORS INFLUENCING ALC GRADE

Climate

- 9 Climate affects the grading of land through the assessment of an overall climatic limitation and also through interactions with soil characteristics
- The key climatic variables used for grading this site are given in Table 2 and were obtained from the published 5km grid datasets using the standard interpolation procedures (Met Office 1989)

Table 2 Climatic and altitude data

	Factor	Units	Values
,	Grid reference	N/A	SU 437 408
•	Altıtude	m AOD	65
	Accumulated Temperature	day C	1470
	Average Annual Rainfall	mm	776
	Field Capacity Days	days	168
	Moisture Deficit Wheat	mm	105
	Moisture Deficit Pointoes	mm	97

- 11 The climatic criteria are considered first when classifying land as climate can be overriding in the sense that severe limitations will restrict land to low grades irrespective of favourable site or soil conditions
- The main parameters used in the assessment of an overall climatic limitation are average annual rainfall (AAR) as a measure of overall wetness and accumulated temperature (ATO January to June) as a measure of the relative warmth of a locality

The combination of rainfall and temperature at this site mean that under this warm and relatively moist climate wetness and workability limitations may be enhanced on the heavier textured soils. In addition soils will need a moderately high available water capacity to avoid droughtiness limitations. There is however no overall climatic limitation in this area, the site is climatically Grade 1.

Site

The site falls gently in a general westerly direction from a high point of 75 m AOD on the eastern boundary to 55 m AOD at the south west corner of the site. Gradients are relatively gentle ranging from 2-4°. There are therefore no site factors which are limiting to the ALC grading of the site.

Geology and soils

- The published geological information for the area (BGS 1975) shows the site to be underlain by Upper Chalk which is described as soft chalk with many flint nodules
- There is no detailed soil survey map for the area but the reconnaissance soil map (SSEW 1983) shows the area to comprise soils of the Andover I association. These soils are described as shallow well drained calcareous silty soils over chalk on the slopes and crests with deep calcareous and non calcareous fine silty soils in the valley bottoms.

Agricultural Land Classification

- 17 The details of the classification of the site are shown on the attached ALC map and the area statistics of each grade are given in Table 1 page 1
- The location of the auger borings and pits is shown on the attached sample location map and the details of the soils data are presented in Appendix III

Grade 2

The majority of the site has been classified as Grade 2 very good quality agricultural land and comprises moderately deep silty soils overlying fissured—soft chalk—The soils typically have a medium or heavy silty clay loam topsoil with 4% flint stones overlying a well structured heavy silty clay loam subsoil—which in turn overlies chalk at 50 60 cm depth—The soil pit described on similar—but slightly shallower soils on the neighbouring site (Site 3—east of Barton Stacey) shows that the subsoil structure is strong fine and medium subangular blocky and that the plant roots extend at least 30 cm into the underlying chalk—Moisture balance calculations therefore indicate that these soils will be slightly droughty for deeper rooting crops restricting the land quality to Grade 2

Subgrade 3a

At the south eastern corner of the site similar but shallower soils overlying chalk have been mapped. These soils typically have a silty clay loam topsoil overlying a heavy silty clay loam upper subsoil overlying fissured soft chalk at 28 40 cm depth. Moisture balance calculations indicate that the soils in this area will be slightly to moderately droughty

restricting the land quality in this area to Subgrade 3a. It should be noted that shallow soils may occur locally giving rise to a Subgrade 3b classification but these are not considered to be widespread and are included within the Subgrade 3a classification.

APPENDIX I

DESCRIPTIONS OF THE GRADES AND SUBGRADES

Grade 1 Excellent Quality Agricultural Land

Land with no or very minor limitations to agricultural use. A very wide range of agricultural and horticultural crops can be grown and commonly includes top fruit soft fruit salad crops and winter harvested vegetables. Yields are high and less variable than on land of lower quality.

Grade 2 Very Good Quality Agricultural Land

Land with minor limitations which affect crop yield cultivations or harvesting. A wide range of agricultural or horticultural crops can usually be grown but on some land of this grade there may be reduced flexibility due to difficulties with the production of the more demanding crops such as winter harvested vegetables and arable root crops. The level of yield is generally high but may be lower or more variable than Grade 1 land.

Grade 3 Good to Moderate Quality Land

Land with moderate limitations which affect the choice of crops the timing and type of cultivation harvesting or the level of yield. When more demanding crops are grown, yields are generally lower or more variable than on land in Grades 1 and 2

Subgrade 3a Good Quality Agricultural Land

Land capable of consistently producing moderate to high yields of a narrow range of arable crops especially cereals or moderate yields of a wide range of crops including cereals grass oilseed rape potatoes sugar beet and the less demanding horticultural crops

Subgrade 3b Moderate Quality Agricultural Land

Land capable of producing moderate yields of a narrow range of crops principally cereals and grass or lower yields of a wider range of crops or high yields of grass which can be grazed or harvested over most of the year

Grade 4 Poor Quality Agricultural Land

Land with severe limitations which significantly restrict the range of crops and/or the level of yields. It is mainly suited to grass with occasional arable crops (e.g. cereals and forage crops) the yields of which are variable. In moist climates, yields of grass may be moderate to high but there may be difficulties in utilisation. The grade also includes very droughty arable land.

Grade 5 Very Poor Quality Agricultural Land

Land with severe limitations which restrict use to permanent pasture or rough grazing except for occasional pioneer forage crops

APPENDIX II

SOIL WETNESS CLASSIFICATION

Definitions of Soil Wetness Classes

Soil wetness is classified according to the depth and duration of waterlogging in the soil profile. Six soil wetness classes are identified and are defined in the table below

Wetness Class	Duration of waterlogging ¹						
ı	The soil profile is not wet within 70 cm depth for more than 30 days in most years 2						
11	The soil profile is wet within 70 cm depth for 31 90 days in most years or if there is no slowly permeable layer within 80 cm depth it is wet within 70 cm for more than 90 days but only wet within 40 cm depth for 30 days in most years						
Ш	The soil profile is wet within 70 cm depth for 91 180 days in most years or if there is no slowly permeable layer present within 80 cm depth, it is wet within 70 cm for more than 180 days but only wet within 40 cm depth for between 31 90 days in most years						
ΙV	The soil profile is wet within 70 cm depth for more than 180 days but not wet within 40 cm depth for more than 210 days in most years or if there is no slowly permeable layer present within 80 cm depth it is wet within 40 cm depth for 91 210 days in most years						
v	The soil profile is wet within 40 cm depth for 211 335 days in most years						
VI	The soil profile is wet within 40 cm depth for more than 335 days in most years						

Assessment of Wetness Class

Soils have been allocated to wetness classes by the interpretation of soil profile characteristics and climatic factors using the methodology described in Agricultural Land Classification of England and Wales Revised guidelines and criteria for grading the quality of agricultural land (MAFF 1988)

¹ The number of days is not necessarily a continuous period

² In most years is defined as more than 10 out of 20 years

Soil abbreviations Explanatory Note

Soil Pit Descriptions

Soil boring descriptions (boring and horizon levels)

Database Printout Horizon Level Information

SOIL PROFILE DESCRIPTIONS EXPLANATORY NOTE

Soil pit and auger boring information collected during ALC fieldwork is held on a computer database. This uses notations and abbreviations as set out below

Boring Header Information

- 1 GRID REF national 100 km grid square and 8 figure grid reference
- 2 USE Land use at the time of survey The following abbreviations are used

ARA	Arable	WHT	Wheat	BAR	Barley	
CER	Cereals	OAT	Oats	MZE	Maize	
OSR	Oilseed rape	BEN	Field Beans	BRA	Brassicae	
POT	Potatoes	SBT	Sugar Beet	FCD	Fodder Crops	
LIN	Linseed FRT		Soft and Top Fruit	FLW	Fallow	
PGR	Permanent Pastur	eLEY	Ley Grass	Rough Grazing		
SCR	Scrub			CFW	Conferous Woodland	
DCW	Deciduous Wood					
HTH	Heathland	BOG	Bog or Marsh	FLW	Fallow	
PLO	Ploughed SAS		Set aside OT		Other	
HRT	Horticultural Crop	os				

- 3 GRDNT Gradient as estimated or measured by a hand held optical clinometer
- 4 GLEY/SPL Depth in centimetres (cm) to gleying and/or slowly permeable layers
- 5 AP (WHEAT/POTS) Crop adjusted available water capacity
- 6 MB (WHEAT/POTS) Moisture Balance (Crop adjusted AP crop adjusted MD)
- 7 DRT Best grade according to soil droughtiness
- 8 If any of the following factors are considered significant Y will be entered in the relevant column

MREL	Microrelief limitation	FLOOD	Flood risk	EROSN	Soil erosion risk
EXP	Exposure limitation	FROST	Frost prone	DIST	Disturbed land
CHEM	Chemical limitation				

9 LIMIT The main limitation to land quality The following abbreviations are used

OC	Overall Climate	ΑE	Aspect	EX	Exposure
FR	Frost Risk	GR	Gradient	MR	Microrelief
FL	Flood Risk	TX	Topsoil Texture	DP	Soil Depth
CH	Chemical	WE	Wetness	WK	Workability
DR	Drought	ER	Erosion Risk	WD	Soil Wetness/Droughtiness
ST	Topsoil Stonines	SS			

Soil Pits and Auger Borings

1 TEXTURE soil texture classes are denoted by the following abbreviations

S	Sand	LS	Loamy Sand	SL	Sandy Loam
SZL	Sandy Silt Loam	\mathbf{CL}	Clay Loam	ZCL	Silty Clay Loam
ZL	Silt Loam	SCL	Sandy Clay Loam	C	Clay
SC	Sandy Clay	ZC	Silty Clay	OL	Organic Loam
P	Peat	SP	Sandy Peat	LP	Loamy Peat
PL	Peaty Loam	PS	Peaty Sand	MZ	Marine Light Silts

For the sand loamy sand sandy loam and sandy silt loam classes the predominant size of sand fraction will be indicated by the use of the following prefixes

- F Fine (more than 66% of the sand less than 0 2mm)
- M Medium (less than 66% fine sand and less than 33% coarse sand)
- C Coarse (more than 33% of the sand larger than 0 6mm)

The clay loam and silty clay loam classes will be sub divided according to the clay content M Medium (<27% clay) H Heavy (27 35% clay)

- 2 MOTTLE COL Mottle colour using Munsell notation
- 3 MOTTLE ABUN Mottle abundance expressed as a percentage of the matrix or surface described

F few <2% C common 2 20% M many 20 40% VM very many 40% +

- 4 MOTTLE CONT Mottle contrast
 - F faint indistinct mottles evident only on close inspection
 - D distinct mottles are readily seen
 - P prominent mottling is conspicuous and one of the outstanding features of the horizon
- 5 PED COL Ped face colour using Munsell notation
- 6 GLEY If the soil horizon is gleyed a Y will appear in this column If slightly gleyed an S will appear
- 7 STONE LITH Stone Lithology One of the following is used

HR	all hard rocks and stones	SLST	soft oolitic or dolimitic limestone
CH	chalk	FSST	soft fine grained sandstone
ZR	soft argillaceous or silty rocks	GH grav	el with non porous (hard) stones
MSST	soft medium grained sandstone	GS grav	el with porous (soft) stones
SI	soft weathered igneous/metamory	phic rock	

Stone contents (>2cm >6cm and total) are given in percentages (by volume)

8 STRUCT the degree of development size and shape of soil peds are described using the following notation

degree of development WK weakly developed MD moderately developed

ST strongly developed

ped size F fine M medium

C coarse VC very coarse

ped shape S single grain M massive

GR granular AB angular blocky

SAB sub angular blocky PR prismatic

PL platy

9 CONSIST Soil consistence is described using the following notation

L loose VF very friable FR friable FM firm VM very firm

EM extremely firm EH extremely hard

10 SUBS STR Subsoil structural condition recorded for the purpose of calculating profile droughtiness G good M moderate P poor

- 11 POR Soil porosity If a soil horizon has less than 0.5% biopores >0.5 mm a Y' will appear in this column
- 12 IMP If the profile is impenetrable to rooting a Y will appear in this column at the appropriate horizon
- 13 SPL Slowly permeable layer If the soil horizon is slowly permeable a Y' will appear in this column
- 14 CALC If the soil horizon is calcareous a Y will appear in this column
- 15 Other notations

APW available water capacity (in mm) adjusted for wheat

APP available water capacity (in mm) adjusted for potatoes

MBW moisture balance wheat MBP moisture balance potatoes
