

Table 1. Climatic and Vegetational Post glacial History of England

Period	Vegetation	Climate	Temp.
VIII Sub-Atlantic 2.5-0.9 ¹	Mixed wood & expanding open spaces	cool O ²	0.5-1.0°C L ³
VIIb Sub-Boreal 5.0-2.5	Mixed wood & expanding open spaces		
VIIa Atlantic 7.0-5.0	Mixed oak, Lime & Alder increasing Peat bogs developing	warm O	July 3.0oC H Jan. 2.0oC H
VI Boreal 9.0-7.0 (V & VI)	-Lime & Alder influx -Oak expansion -Elm & Oak increase Pine & Hazel codominant	warm C	
V Boreal	Birch & Hazel increase	warm C	
IV Pre Boreal 9.6-9.0	Birch expansion Herbs & shrubs decline	warmer	July = or H
Late Glacial III 10.8-9.6	Herbs dominant, Birch confined to SE	cold	
II 12.0-10.8	Birch spread, Pine in SE England	warm	
I 13.5-12.0	Herbs dominant	cold	

1: Approximate age (thousand years).

2: O Oceanic climate (mild, wet); C Continental climate (drier, more extreme seasons).

3: L lower than present; H higher than present.

Adapted from Dennis (1977).

Table 2. **Belle Vue weather station mean monthly rainfall
1892-1982**

Month	n	Mean (mm)	SE	Min (mm)	Max (mm)
Jan.	89	81.0	6.0	34.0	133.0
Feb.	89	66.8	8.5	4.8	174.8

Table 5. Vegetation classes used in mapping

Class	Symbol	Main features
<i>Calluna</i>		
0-1 year old burn	0	Bare, charred ground with varying amounts of old stems
2-3 year old burn	1	Old stems absent; <i>Calluna</i> shoots growing c4cm per year. Bilberry often common
Less than 30cm	2	c3-5 year old burns; thin, upright <i>Calluna</i> in regular sward
More than 30cm	3	Old, leggy <i>Calluna</i> , forming a stand of irregular height and with many plants tumbling at the base
Senescent	3a	Highly eroded community typical of the edge of high plateaux with areas of bare peat and <i>Empetrum nigrum</i> between very thin <i>Calluna</i>
Bracken	B	Normally absolutely dominant on slopes, and often invading <i>Molinia</i>
<i>Molinia</i>	Mol	<i>Molinia caerulea</i> forming tussocks of various size
Burnt <i>Molinia</i>	bMol	<i>Molinia</i> burnt in spring as summer grazing for sheep
<i>Nardus</i>	N	<i>Nardus stricta</i> , normally forming short tussocks; diagnostic of extreme overgrazing
<i>Agrostis/Festuca</i>	A/F	Grassland dominated by <i>Agrostis tenuis</i> , <i>Festuca rubra</i> & <i>F.ovina</i> , often with small amounts of <i>Deschampsia flexuosa</i>
<i>Juncus</i>	J	Damp, mineral enriched flushes or redundant pastures. Various species, but mainly <i>J.squarrosum</i> & <i>J.conglomeratus</i>
<i>Eriophorum</i>	Er	<i>Eriophorum vaginatum</i> dominant on wet plateaux; <i>E.anustifolium</i> present throughout in smaller quantities
<i>Empetrum</i>	Em	<i>Empetrum nigrum</i> found scrambling over bare rock or the thinnest soil, or in eroded peat
Bilberry	By	<i>Vaccinium myrtillus</i> found on well drained slopes with thin soil

Two small patches of *Erica cinerea* and *E.tetralix* and *Scirpus caespitosus* were mapped. Woodland, conifer plantation, reservoir and reservoir edge, and quarry bottom were also mapped.

Table 6. Enclosed land classification

Class	Symbol	Main Features
Improved (Pasture or reseed) short	Is	Very short grass (<10cm), mainly <i>Agrostis</i> , <i>Festuca</i> and <i>Poa</i> and no wild flowers. Pasture land, often with <i>Juncus</i> flushes
long	II	Longer grass (>10cm to 50cm); reseeds, with Italian Rye Grass <i>Lolium perenne</i> predominating. Very dense grass with no wild flowers other than some Dandelions and buttercups
cut	cut	Cut within two weeks for hay or silage
Unimproved (Meadow) short	Ms	Moderately short (10-15cm); wild flowers and grasses common
long	MI	Longer sward (>15cm); wild flowers and grasses common, especially Yorkshire Fog <i>Holcus lanatus</i>

Table 7. Habitat features recorded at nest sites

Feature	Classes
Slope	<30°, 30-45°, >45°
Aspect	Direction of nest slope, and the direction to which the nest faced (ie. where bird would enter)
Nest Height	Height from the ground to the top of the nest cup
Vegetation	Vegetation class (see Table 5)
Surrounding vegetation	The proportion (to nearest 10%) which each vegetation class (see Table 5) formed in a 30m radius around the nest site
Vegetation height	Height of five highest points (to nearest 5cm) in 1m ² quadrats, one centred over the nest, and adjacent quadrats uphill, downhill, to left and right of the nest; in the case of nests in Bracken, the number of stems in each quadrat was also recorded

Table 8. Land proportions in the Midgley study area

Class ¹	n ²	Total (ha)	Mean (ha) ³	SE	% of Total Area	% of Land Available ⁴
0	34	10.65	0.31	0.06	3.50	7.43

Other	--	10.66	----	----	1.46	----
Fields	92	134.78	1.47	0.19	18.41	----
TOTAL:		732.08			(Total available 563.13ha)	

3: "Total Available" is the total land available to nesting Twite which is the Total minus Wood, Reservoir, Other, and Fields; this is equal to 563.13ha.

See Table 8 for explanation of symbols 1 & 2.

Table 11. Twite densities in different field types in the Midgley study area May 18th - June 13th

Class ¹	No. Days ²	Cum. ha ³	Twite Days	Total Twite	Total/Cum ha ⁴	T Days/Cum ha ⁵
I _s D0	320	267.19 (73)	7	16	0.06	0.03
D1	19	15.31 (3)	1	5	0.33	0.07
II D0	43	30.28 (10)	0	0	0.00	0.00
Cut (D0)	12	11.87 (11)	0	0	0.00	0.00
Ms D0	17	22.62 (3)	0	0	0.00	0.00
Ms D1	166	120.30 (29)	9	49	0.41	0.07
Ms D2	5	4.15 (1)	0	0	0.00	0.00
MI D1	207	159.70 (45)	2	6	0.04	0.01
D2	55	41.74 (9)	3	6	0.14	0.07
Urban	8	c49.20	3	6	c0.12	c0.06

Rearranged⁶:

D0	392	668.96 (111)	7	16	0.02	0.01
D1	392	295.31 (77)	12	60	0.20	0.04
D2	60	45.89 (10)	3	6	0.13	0.07

- 1: See Table 6 and section 2.2 (Methods) for explanation of abbreviations.
- 2: Cumulative number of days for each class; two visits to the same field contribute two days to the appropriate class.
- 3: Cumulative hectarage for each class; two visits to a 1ha field contribute 2ha to the appropriate class. Numbers of fields contributing to each class are given in brackets.
- 4: "Total/Cum Ha" gives the total number of Twite divided into the cumulative area, giving density (Twite.ha⁻¹).
- 5: "T Days/Cum Ha" gives the number of occasions on which at least one Twite was present (ie. a Twite day) in a particular class divided by the cumulative hectarage of that class; this figure removes some of the bias in the Total/Cum Ha figure resulting from large flocks.
- 6: Urban not included, as Dandelion density extremely variable.

See also Appendix II

				Mean Dandelions: 0.67
				Mean Sorrel: 1.50

1: Figures are numbers of fields; figures in brackets are hectarages.

Table 21. Nests found in the three study areas

Area	Year	n	Nests found¹
Midgley	1993	3	2 c/5; 1 c/6
	1994	6	1 c/4*; 3 c/5; 2 c/6
Withens Clough	1993	5	4 c/5; 1 c/6
	1994	4	1 c/5; 1 c/6; 1 h/5; 1 f/6
Rishworth	1989	7	5 c/5; 1 c/6; 1 h/5
	1992	5	4 c/5; 1 c/6
	1993	4	4 c/5
	1994	5	1 c/5; 2 c/6; 1 h/6; 1 f/5

The mean clutch sizes are as follows:

Area	n	Mean	SE
Midgley	8	5.38	0.17
Withens Clough	7	5.29	0.17
Rishworth	18	5.22	0.10
1989	6	5.17	0.15
1992	5	5.20	0.18
1993	12	5.17	0.11
1994	10	5.50	0.16
Total	33	5.27	0.08

1: c indicates clutch size (eg. c/5= clutch of 5), h indicates number of nestlings, and f number of fledglings. The numbers given are the maximum for the nest at the state of discovery, so "c" indicates that a nest was found at egg stage etc.; the numbers are not necessarily the number present at discovery (because of incomplete clutches).

*: This nest could not be relocated and the clutch may have been incomplete.

Table 22. Timing of breeding

Study area	Year	n	First Egg Dates ¹		
			Mean	Earliest ²	Latest ²
Midgley	1993	1	15 May		
	1994	2	19-21 May	14 May	25 May
	1994 2nd broods ³	2	6 July	5 July	7 July
Withens Clough	1993	1	11 May		
	1994	3	19-21 May	13-15 May	25-28 May
Rishworth	1989	7	16-18 May	8-10 May	1 June
	1992	1	13 May		
	1993	2	7-9 May	9 May	6-11 May
	1994	3	3-5 June	31 May-1 June	9-10 June
Grouped	1st broods	20	19-21 May	9 May	9-10 June
	2nd broods	2	6 July	5 July	7 July

1: First egg date calculated on the basis of a twelve day incubation period, incubation beginning with the fourth egg (Taylor 1935, Newton 1972, Brown et al. 1994, and see Table 23), and estimates of young chicks' age. Dates were split into three day classes (eg. class 1= 1-3 May, 2 =4-6 etc.) and nests divided between the appropriate classes; nests were only included if the first egg date could be calculated to within three days.

2: Earliest and latest dates are those calculated and are often in less than three day intervals.

3: Nests were divided into first and second broods depending if the first egg date was before or after June 16th; this allows for a twelve day incubation period and fifteen day nestling period from May 19th (mean first egg date), and Twite are known to have a short gap between broods (Marler & Mundinger 1975).

Table 23. Known hatching & fledging dates

Nest ¹	Hatching Date	Fledging date	Period
M4	1 June	12 June	12 days
W8	3 June	11-14 June	9-12 days

1: See Appendix I for nest histories.

These are the only two nests for which the fledging date is known to within four days; in the case of M4 the birds fledged when HM approached the nest and never returned to it, and the chicks were known to have hatched on June 1st.

Table 24. Causes of loss of nests found at the egg stage, and breeding success 1989-1994

Of 158 eggs in 30 clutches which were revisited at least once

No. Eggs	No. Clutches	Reason for loss	% of Eggs ¹	% of Clutches
5	1	Unknown	3.2	3.3
10	2	Washed out	6.3	6.6
27	5	Predated	17.1	16.7
5	1	Disturbed by sheep	3.2	3.3
9 ²	8	Failed to hatch	5.7	26.7
Leaving 102 young from 21 clutches, of which:				
9	2	Washed out	5.7	6.7
12	2	Predated	7.6	6.7

56 young (35.4%) in 11 broods (36.7%) are known to have fledged.

An additional 17 young (10.8%) in 4 broods (13.3%) are known to have reached ten days old, so almost certainly fledged.

The remaining 8 young (5.1%) in 2 broods (6.7%) were not visited after the young were five days old, giving error around breeding success:

56+17 young fledged, and 8 possibles=

73-81 fledglings (46.2-51.3% ofeggs)

in 15-17 broods= 50-56.7% of clutches

Another 3 nests were found with young, and of these 16 young, all fledged.

1: Percentages are of the original 158 eggs in 30 clutches throughout.

2: Partial losses.

Table 25. Nest failure rates compared with those of NRC from the southern Pennines (from Brown et al. 1994)

Nest failure rates were calculated using the Mayfield method (Mayfield 1961, 1975), and standard errors from Johnston (1979). The daily nest failure rate is calculated by dividing the total period in days for which a set of nests were visited (the "exposure") into the number of nests which failed in that time (partial losses are not considered). Where a nest failed between visits, it is assumed to have survived for half of the period between visits, thus:

Daily nest failure rate (m) = Number failing / Exposure

$$\text{Standard Error} = \sqrt{\frac{(\text{Exposure} - \text{No. failing}) \times \text{No. failing}}{(\text{Exposure})^3}}$$

Stage	Present study			Brown et al. (1994)			z-test ¹
	n	m	SE	n	m	SE	
Egg	25	0.0307	0.0114	335	0.0199	0.0025	NS
Nestling	20	0.0177	0.0088	285	0.0164	0.0025	NS
Egg-Fledge	28	0.0243	0.0072	445	0.0210	0.0018	NS

1. z-test for the difference between two means.

Table 26. Large scale selection: vegetation types in which nests were situated

Area & Vegetation	n	% of Nests	ha ¹	% of Area ²	Nests/ha ³
<u>Midgley</u>					
Burnt <i>Calluna</i> (0)	2	20	10.65	7.43	0.188
Mature <i>Calluna</i> (3)	8	80	30.39	21.20	0.263
<u>Withens Clough</u>					
Bracken (B)	13	100	94.32	10.01	0.138
<u>Rishworth</u>					
Bracken (B)	23	92	70.53	12.52	0.326
<i>Eriophorum</i> (Er)	1	4	231.52	41.11	0.004
<i>Molinia</i> (M)	1	4	130.36	23.15	0.008

- 1: Hectarage of the appropriate vegetation class in the appropriate study area (see Tables 8-10).
 2: Percentage which that vegetation class forms of the land available to nesting Twite (see Tables 8-10).
 3: Number of nests per hectare. Figures give the relative importance of vegetation types within each study area, and cannot be compared between study areas, as observations have been made on the three areas for different lengths of time.

Table 27. Selection of patch sizes for nest sites (ha)

Area & Vegetation	Nest Sites ¹			Study Area ²			P ³
	n	Mean	SE	n	Mean	SE	
<u>Midgley</u>							
Burnt <i>Calluna</i> (0)	2	0.15	0.00	34	0.31	0.06	NS

		M5	69	1.7	69	1.1
		M6	71	3.3	68	2.4
		M8	78	4.8	78	1.6
		M9	76	4.1	82	1.5
Bracken (B)	3	W8	35	---	51 (7)	4.5
		W9	55	---	55 (6)	3.0
		W10	35	---	55 (5)	5.0

1: Mean height (cm) of five tallest spikes of vegetation in 1m² centred on nest; in case of nests in bracken, the height of the bracken clump (cm), and number of clumps in brackets.2: Mean height (cm) of twenty tallest spikes of vegetation, five each from 1m² to north, east, west, and south of 1m² over nest.

Table 31. Gradient of nest slopes

Area	Gradient		
	<30°	30-45°	>45°
Midgley	7	1	0
Withens	9	1	0
Rishworth	6	13	0

Figures are numbers of nests

Table 32. Altitude of nests

Area	n	Altitude (metres asl)			
		Mean (m)	SE	Min	Max
Midgley	6	323	4	310	335
Withens	10	312	6	285	355
Rishworth	15	298	4	280	325
Total	31	307	3	280	355

Table 33. Aspect of nest in relation of that of the nest slope

Area	Nest Slope	n	Nest	n
Midgley	E	3	E	1
	ESE	1	SE	1
	S	2	S	1
	SSW	1	E	1
Withens	NNW	1	ENE	1
	NNE	2	NNE	1
			ESE	1
	NE	1	ENE	1
	E	1	E	1
	ESE	2	ESE	1
			NNW	1
Rishworth	NW	1	NW	1
	NNW	2	NNW	2
	N	6		
	ENE	1		
	E	1		
	ESE	1	ESE	1
Rishworth	SE	1		
	S	1	N	1
	WNW	5		
	NW	1		

Grouped:

Area	n	Mean Direction to which SE nests faced	
Midgley	8	135.0° (=SE)	15.4
Withens	10	29.2° (=NNE)	16.5
Rishworth	17	1.3° (=N)	15.4

The direction to which the nest faced was significantly correlated with the aspect of the slope ($P<0.001$, $t=4.36$ at 17 degrees of freedom).

Table 34. Known feeding sites of pairs

It was difficult to prove that birds were indeed flying long distances between the nesting and feeding grounds, but the lines given below are certain.

Site	Nest ¹	Fields ²
Midgley	M4	32 (0.10), 33 (0.10), 36 (0.30), <u>44</u> (0.70), <u>45</u> (0.75)
	M5	44 (0.10), 45 (0.15),
	M8	111 (0.95), 156 (0.95)
	M9	111 (0.75), 156 (0.75)
Withens	W1	Cockhill
	W3	118 (0.85)
	W4	118 (1.15)
	W5	Cockhill
	W6	Cockhill
	W7	Cockhill
	W8	115 (1.10), 118 (1.55)
	W9	23 (1.75), 24 (1.65), <u>26</u> (1.50), <u>27</u> (1.50), 29 (1.75)
	W10	118 (0.95)
	WA	125 (c0.10)
	WB	26 (2.15)
	WC	26 (c2.60)

Mean = 1.13km; SE = 0.139

1: See Maps 2-4 and 5-7.

2: Numbers are field numbers (see Maps 2-4), numbers in brackets are distances (km) from the nest to the nearest 0.05km. Underlined field numbers indicate the main feeding site
