4.3 Vulnerability

The site is managed as a National Nature Reserve by English Nature. The principal threats from human influences are water quality problems (from sewage discharges and agricultural run-off), wildfowling and recreational disturbance including bait-digging. Colonisation by *Spartina* poses a long-term threat to intertidal habitats. A metalled road to Holy Island across the intertidal area has had localised effects on the areas of saltmarsh, intertidal flats and sand dunes and may be resulting in longer-term changes to sediment patterns within the Fenham Flats area of the SPA.

The issue of water quality in input streams and sedimentation/siltation within the site is currently being monitored by the Environment Agency. English Nature monitor and manage recreational and wildfowling use of the site in order to address issues of disturbance. Bait-digging is controlled by a SNCO. English Nature is currently trialing experimental management techniques to control *Spartina*.
