

**FUGGLESTON RED, SALISBURY (67/98)**

**AGRICULTURAL LAND CLASSIFICATION**

**FILE NOTE**

A reconnaissance style survey was undertaken at the end of July 1998. A total of 16 auger borings and 2 topsoil pits were examined.

The primary limitation over the site was found to be topsoil stone content at Subgrade 3b. The two pits had 20% and 15% hard rock greater than 2cm. A few of the borings were Subgrade 3a due to topsoil stones but these were in the minority and did not appear to form a separate mapping unit.

No ALC map was produced because the distribution of mapping units could not be accurately mapped although the majority of the site would be Subgrade 3b.

These findings were in line with those from an adjacent survey in 1989 and a recent survey by Reading Agricultural Consultants which was coincident.
